Sequence 6, Application US/09463048A
Patent No. 6630619
GENERAL INFORMATION:
APPLICANT: Commonwealth Scientific and Industrial Research Organi
APPLICANT: EAST, Peter David
TITLE OF INVENTION: Toxin Genes from the Bacteria Xenorhabdus nen
TITLE OF INVENTION: luminescens
FILE REFERENCE: 050179-0076
CURRENT APPLICATION NUMBER: US/09/463,048A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ..

beta-2 Novel compound capable of reducing level, function or activity of hyaluronan synthase or hyaluronidase, useful for treating cancer, hyperproliferative condition, , A-beta-lipoproteinemia, A-V, A be microglobulin amyloidosis.

SEQ ID NO 50; 277pp; English. 22; Example

This invention describes a novel nucleic acid molecule capable of reducing the level of hyaluronan synthase (HAS) or hyaluronidase (HYAL) or the function or activity of HAS or HYAL. HAS is selected from HAS1, HAS2 and HAS3. HYAL is chosen from HYAL1, HYAL2, HAL3 and PH-20. The nucleic acid molecule is an oligonucleotide or its chemically modified form comprising a chemically modified backbone or a non-natural form comprising a chemically modified backbone or a non-natural internucleoside linkage. The compound is an interactive molecule capable of binding or otherwise associating with HAS and/or HYAL to reduce HAS

ts a peptide
n describes
and/or HYAL function or activity. The novel molecule is useful for treating cancer, hyperproliferative conditions or inflammatory conditions. The products of the invention are useful for treating or prophylaxis of a condition in subject, which involves administering to the subject, an HAS and/or HYAL level-reducing or HAS and/or HYAL activity reducing effective amount of active molecule. The products of the invention have anabolic, hypertensive, gynaecological, neuroprotective, antianemic, cytostatic, anti-inflammatory, endocrinegen. and immunosuppressive activity. This sequence represents a peptide used in the method of the invention. NOTE: The specification describes SEQ ID NO 27-51 as nucleotide primers however the Sequence Listing represents the nucleotides in a three letter amino acid code, The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to an isolated nucleic acid molecular encoding a polypeptide which is believed to be cytostatic, antiinflammatory, immunosuppressive, antibacterial and virucidal. composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammato: immune, metabolic, genetic, bacterial and viral diseases. The pressence represents a human secreted protein. The present sequence available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PA, be...

The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antiinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                    olecule for diagnosing, preventing or tre
ive (e.g. cancer), inflammatory, immune,
and viral diseases.

                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                        The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolat and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules has been determined. Primers for synthesising the full length cDNA are u for clarifying the function of the protein encoded by the cDNA. The length clones were obtained by construction of full length enriched libraries that were synthesised by the oligo-capping method. The price anable the production of the full length cDNA easily without any spenthuman cDNA of the invention. Note: The sequence data for this patent not form part of the printed specification, but was obtained in CD-Reformat directly from EPO
                                                                  H

                                                                                    This invention relates to a novel primers useful for synthesising full length cDNA molecules that encode human proteins. Specifically, it refers to secretory or membrane proteins that are potential therapeutic agents/ target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction, glycoproteins and transcription. The present invention describes a method for efficiently cloning a full length human cDNA from both the 5' and 3' ends using the oligo-capping method. This polypeptide sequence is a full length human protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antibacterial; Virucide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to an isolated nucleic acid moler
encoding a polypeptide which is believed to be cytostatic,
antiinflammatory, immunosuppressive, antibacterial and virucida
composition and methods are useful for diagnosing, preventing a
treating diseases such as proliferative (e.g. cancer), inflamma
immune, metabolic, genetic, bacterial and viral diseases. The sequence represents a human secreted protein. The present sequence available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          met

The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a prophylaxis and treatment of pathological conditions resulting from a compound, such as a polypeptide, for the ability to bind a P. aeruginosa uncleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences AB067826-Components species using biochip technology. Sequences AB067826-Componence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at
                                                                                                                                                                                                            Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antiinflammatory; neuroprotective; antianaemic; cytostatic; vulnerary; inflammatory; haematopoiesis; immunity; neurodegenerative; stem cell; aplastic anaemia; cancer; wound healing; gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antiinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.

                                                                                                                                                                                               he
                                                                                                                                                                                        The invention relates to a novel isolated polynucleotide and the polypeptide. The molecules of the invention demonstrate antiinfl neuroprotective, antianaemic, cytostatic and vulnerary activitie be useful in preparing a composition for diagnosing or treating inflammatory, haematopoietic, immune, neurodegenerative or stem disorders, such as aplastic anaemia or cancer, as well as for prwound healing. The molecules may also be utilised during gene th procedures. The current sequence is that of a human therapeutic protein of the invention.
                                                                         Z, Ma
Weng G,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Immunosuppressive; Antibacterial human secreted protein.

                                                                                                                                                                                                                                 Virucide;
antiinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.

```

```
The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antiinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  olecule for diagnosing, preventing or treating distive (e.g. cancer), inflammatory, immune, metabolic, and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                 New nucleic acid molecule for diagnosing, preventing or treating dise
such as proliferative (e.g. cancer), inflammatory, immune, metabolic,
genetic, bacterial and viral diseases.

The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a pathological infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences AB067826-.

AB084396 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at sequence.

The

acid molecule

The present sequence is

composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.

The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antiinflammatory, immunosuppressive, antibacterial and virucidal composition and methods are useful for diagnosing, preventing and

activity useful for VEGFR-3 a New isolated peptide that inhibits VEGF-C and VEGF-D, I diagnosing, evaluating, treating disorders mediated by such as cancer and diseases of neovascularization.

Claim 13; Page 80; 149pp; English.

and of The present invention describes an isolated peptide (I) that binds to a inhibits vascular endothelial growth factor receptor 3 (VEGFR-3). (I) have cytostatic, hepatotropic, antiinflammatory, hypotensive, antidiabetic and vulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for diagnosing, evaluating and treating disorders mediated by the activity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes an isolated peptide (I) that binds to inhibits vascular endothelial growth factor receptor 3 (VEGFR-3). (I) have cytostatic, hepatotropic, antiinflammatory, hypotensive, antidiabetic and vulnerary activities, and can be used in gene therapy compositions and methods from the present invention are useful for diagnosing, evaluating and treating disorders mediated by the activity
the cell surface receptor VEGFR-3 such as cancer, e.g. brain, lung, liver, spleen, kidney, lymph node, small intestine, blood cells, pancreas, colon, stomach, breast, endometrium, prostate, testicle, ovskin, head and neck, oesophagus, bone, marrow or blood, and diseases neovascularisation, e.g. liver diseases, hypertension, post-trauma, chronic hepatitis, haemangiomas and diabetes. The present sequence represents a specifically claimed VEGFR-3 binding peptide from the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel polynucleotide encoding a guanosine triphosphate-binding protein coupled receptor (GPCR). A polynucleotide the invention may have a use in gene therapy. The polynucleotide and polypeptide are useful for preparing a composition for treating a patie in need of increased or suppressed activity or expression of the guanosine triphosphate-binding protein coupled receptor. The protein sequences shown in ADC85549-ADC87617 represent GPCR's of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ø
the cell surface receptor VEGFR-3 such as cancer, e.g. brain, lung, liver, spleen, kidney, lymph node, small intestine, blood cells, pancreas, colon, stomach, breast, endometrium, prostate, testicle, ov skin, head and neck, oesophagus, bone, marrow or blood, and diseases neovascularisation, e.g. liver diseases, hypertension, post-trauma, chronic hepatitis, haemangiomas and diabetes. The present sequence represents a VEGFR-3 binding peptide, which is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                 receptor;

The molecules of the invention demonstrate cytostatic activity whilst the method may be useful for selecting target and target binder pairs for preparing a composition for treating cancer. Furthermore, the method may be utilised during gene therapy procedures. The current sequence is that of the cancer-related

                                                                                                                                                                                                                           The invention relates to novel isolated polypeptides comprising a sequence that binds an immunoglobulin Fc region. The polypeptides are useful as binding molecules for detecting, isolating or purifying immunoglobulin Fc-region polypeptides present in a solution, e.g. whole blood, plasma or transgenic milk. The Fc-region binding polypeptides are also useful for regulating or preventing an antibody response, or for increasing the half-life and over all stability of a therapeutic or diagnostic compound that is administered to or enters the circulatory system of an individual. This sequence represents an Fc region binding

The invention relates to a method of evaluating sample by providing a soluble serum protein (I), one or more compounds physically associated with (I), and a (I)-binding agent that comprises a peptide that specifically binds to (I), allowing the (I)-binding agent to bind to (I) to form a complex including one or more compounds physically associated with (I), separating the complex from one or more components of the sample, and evaluating one or more of the physically associated compounds. The sample comprises blood or serum, or is obtained from a biopsy. The sample may also be obtained from a tumour or a region within solupsy. The method is useful for detecting modulators that modulate interaction of serum protein-binding compound and serum protein sequence represents a serum albumin-binding peptide identified using the method of the invention.
                                                                                                     separated
